

# Insulin, glucagon and diabetes mellitus

Dave Bridges, Ph.D.

November 5, 2013

## Lecture Outline

- Physiological regulation of blood glucose
- Insulin Signaling
- Glucagon Signaling
- Pathophysiology related to glucose control

## Acute regulation of circulating glucose

- maintained in narrow range
- postprandially regulated by insulin
- under starvation regulated by glucagon

## Mechanisms of glucose control

- Glucose production
- Removal of glucose from the blood
- Synthesis of triglycerides and glycogen

## Insulin Signaling

- Physiological effects of insulin
- Secretion of insulin
- Insulin signal transduction

## Glucagon Signaling

- Physiological effects of glucagon

- Regulation of glucagon release
- Effects of glucagon on the liver

## **Pathophysiology related to glucose control**

### **Type I Diabetes Mellitus**

- Loss of insulin producing cells
- Treatment options

### **Insulin Resistance and Type II Diabetes Mellitus**

#### **Mechanisms Underlying Insulin Resistance**

- Pharmacological Improvement in Insulin Sensitivity

#### **Adaptations to Insulin Resistance**

- Hyperinsulinemia
- Pancreatic Failure

#### **Other Control Circuits Related to Glucose Control**

- Regulation of food intake
- Counterinflammatory responses
